Workspace Intelligence Hub

Team productivity insights and proactive workflow recommendations for B2B SaaS teams

Author	Deeya
Status	Draft v1.0
Last Updated	March 2026
Platform	B2B SaaS
Target Launch	Q4 2026

6pp Churn Reduction Target 18% → 12% annually	15% Seat Expansion Lift Data-driven upsell	+0.8 CSAT Score Target 3.4 → 4.2 / 5.0
--	---	---

1. Executive Summary

Mid-market B2B SaaS teams struggle to understand how their workforce is actually using the product which features drive value, where teams are stuck, and which accounts are at risk of churning due to low engagement. The Workspace Intelligence Hub introduces a manager-facing analytics layer that surfaces actionable productivity insights, adoption heatmaps, and AI-generated workflow recommendations directly within the platform.

This transforms the platform from a passive tool into a proactive partner, increasing stickiness for decision-makers and reducing churn by surfacing demonstrable value before renewal conversations happen.

The key insight driving this PRD: 74% of churned accounts showed a health score decline of 15+ points in the 60 days before cancellation. With proactive tooling, the majority of these churns are preventable.

2. Problem Statement

2.1 The Core Problem

Managers and team leads in B2B SaaS environments lack visibility into which features their team actively uses, where workflow bottlenecks are costing time, and which team members are at risk of disengaging from the platform. This visibility gap leads to underutilised seats, missed expansion opportunities, and reactive churn management.

Persona	Core Frustration	Business Impact
Team Lead / Manager	"I don't know if my team is using the tool we paid for"	Low NPS, high churn risk
Customer Success Manager	"I find out accounts are struggling too late"	Reactive, not proactive CS
C-Suite Buyer	"We need ROI proof at renewal time"	Renewal objections, downsell

3. Goals & Success Metrics

3.1 Business Goals

- Reduce annual churn rate from 18% to 12% within 12 months of launch
- Increase seat expansion rate by 15% via data-driven upsell conversations
- Raise CSAT for 'product value visibility' from 3.4 to 4.2 / 5.0

Annual Customer Churn: Current vs. Target

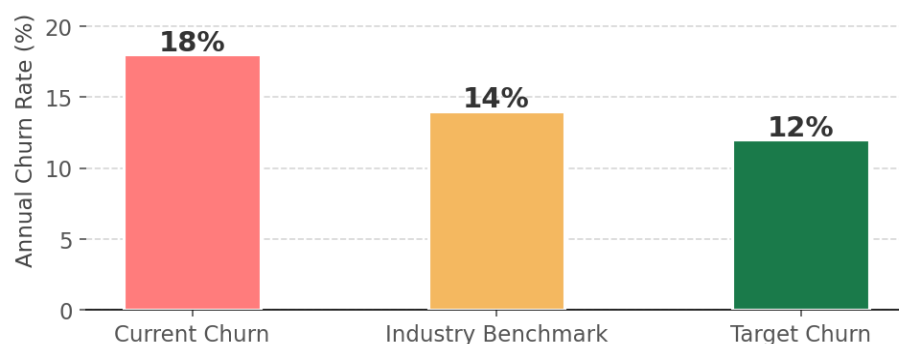

Fig. 1 — Annual Churn Rate: Current State, Industry Benchmark, and 12-Month Target

3.2 Success Metrics

Metric	Baseline	Target	Timeline
--------	----------	--------	----------

Annual customer churn rate	18%	<12%	12 months post-launch
Hub DAU/MAU ratio	—	>40%	6 months post-launch
Expansion revenue influenced	\$0	+\$2M ARR	12 months
Time-to-insight for managers	Manual (hours)	<5 minutes	3 months
CSAT: product value visibility	3.4 / 5.0	4.2 / 5.0	6 months

4. Feature Adoption Context

Current product instrumentation reveals a wide adoption gap across features. High-value capabilities like automations and integrations are being used by fewer than 30% of teams — a clear signal of unactualised value that the Workspace Intelligence Hub is designed to surface and address.

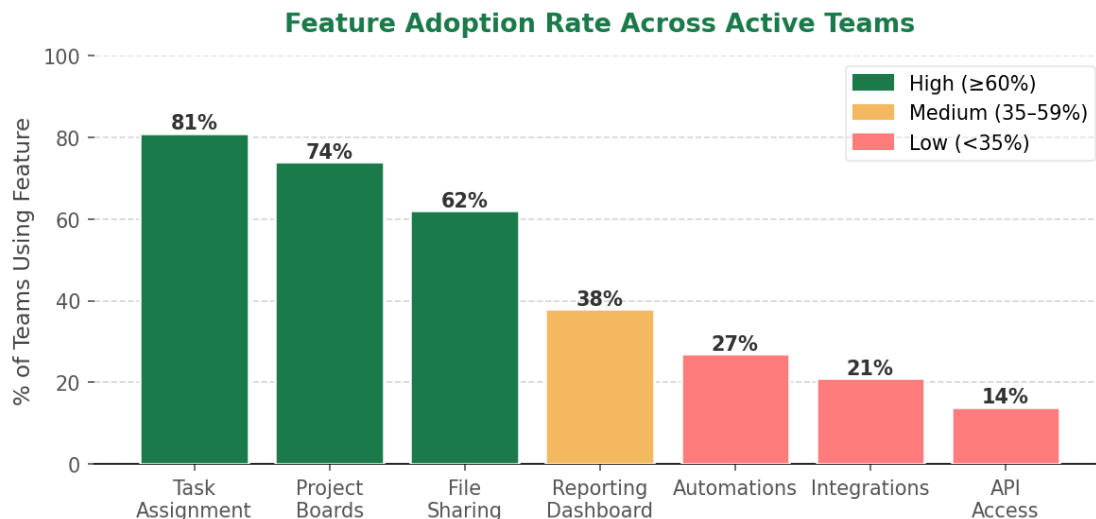

Fig. 2 — Current Feature Adoption Rate Across Active Teams (Green = High, Amber = Medium, Red = Low)

5. Account Health Score Model

The health score (0–100) will be a weighted composite signal derived from three behavioural dimensions: login frequency (30%), feature breadth — number of distinct features used (30%), and task completion rate within key workflows (40%). The distribution of current proxy scores shows a bimodal pattern with a significant at-risk cluster below the 40-point threshold.

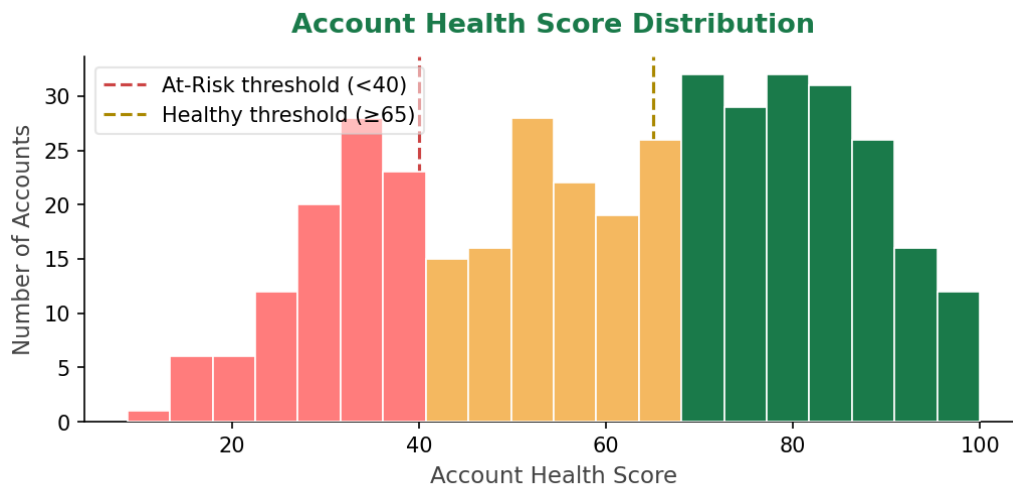

Fig. 3 — Simulated Account Health Score Distribution (Red <40 = At-Risk; Green ≥65 = Healthy)

6. Feature Requirements

6.1 Must-Have (P0)

- **Feature-level heatmap showing active vs. dormant feature usage per team, updated daily.** Team Adoption Dashboard:
- **Per-account/team health score (0–100) with trend line; visible to admins and CSMs.** Health Score Card:
- **Automated flag when a team's health score drops >15 points over 30 days.** At-Risk Alerts:

6.2 Should-Have (P1)

- Workflow Bottleneck Detector: Identify steps with >40% drop-off and surface suggested remedies.
- AI Recommendation Cards: Weekly digest of 3 personalised tips to improve team productivity.
- Benchmark Comparisons: Show how a team's adoption compares to similar-sized industry peers.

6.3 Nice-to-Have (P2)

- ROI Calculator: Auto-generate time-saved metrics for QBR presentations
- Slack/Teams integration: Send health score digests to manager's comms channel

7. User Stories

ID	As a...	I want to...	So that...	Priority
US-01	Team Lead	See which features my team uses most	I can drive adoption of underused tools	P0
US-02	CSM	Get alerted when an account goes at-risk	I can intervene before renewal	P0
US-03	Manager	Understand where workflows break down	I can coach on specific friction points	P1
US-04	Exec Buyer	Generate an ROI report in 1 click	I can justify renewal to finance	P2

8. Technical Considerations

- Event pipeline: Instrument all feature interactions with structured events (user_id, feature_id, action, timestamp)
- Data warehouse: Aggregate to daily/weekly rollups in Snowflake; expose via internal analytics API
- Health score model: Weighted composite — retrained weekly; calibrated with CSM feedback for 60 days
- Latency SLA: Dashboard must load in <2s for datasets up to 500-seat accounts
- Access control: Role-based — admins see all; managers see their team only; no peer-level data for ICs

Dependency	Team	Risk Level
Event instrumentation across all features	Engineering (Platform)	High — backfill needed
Data warehouse pipeline	Data Engineering	Medium — 4–6 weeks build
Health score model	Data Science	Medium — needs calibration
Dashboard UI	Frontend	Low — design system ready

9. Go-to-Market Plan

Phase	Timeline	Scope	Success Criteria
Pilot	Month 1–2	10 enterprise accounts (CSM-selected)	Positive qualitative feedback; ≥3 at-risk catches
Beta	Month 3–4	Top 100 accounts by ARR	Hub DAU/MAU >25%; NPS delta +5

GA	Month 5	All team/enterprise plan customers	Full rollout with onboarding tooltips
Expansion	Month 6–8	Use data to inform upsell conversations	Expansion revenue lift measurable in Salesforce

10. Risks & Mitigations

Risk	Likelihood	Impact	Mitigation
Privacy pushback from team members	High	High	Aggregate-only view; no individual scoring visible to peers
Data quality from partial instrumentation	High	Medium	Launch with 'coverage score' showing % of features instrumented
Low adoption of hub by managers	Medium	High	Embed key insight in existing weekly email digest to seed habit
Health score model miscalibrated	Medium	Medium	Human-in-loop CSM validation for first 60 days post-launch

11. Open Questions

- How do we handle teams with <3 members where aggregation doesn't provide meaningful anonymity?
- Should the health score be visible to end users, or only to admins and CSMs?
- What is the legal/compliance review timeline for EU customer data under GDPR?
